

## WSTIMS For Windows Fix List

Status	Priority	Program Version	Component	Issue	Notes
Closed	H	4.0.0.8	EditMember	Exception encountered when selecting a federation when editing a members registration entry	Was not properly handling drop down selection when an entry was selected from the listed
Closed	H	4.0.0.8	Slalom Entry	Skier received a score of 6 but no continuation. In this case the exit gates are marked as not complete. However score was calculated as 6 buoys greater than it should have	Fixed calculation to handle a score of 6 but no continuation. This was not being handled properly.
Closed	H	4.0.0.8	Registration	Need the ability to indicate that a skier is skiing for score only and not for placement	Added new attribute at both the registration level and event level to indicate a skier is not skiing for placement. This provides the ability to mark this status for each event independently. Skiers marked as not skiing for placement will be excluded from placement in all summary reports and in the final performance data file provided for the ranking list.
Closed	H	4.0.0.8	Trick Award Summary Slalom Award Summary Jump Award Summary	Issues printing the Awards Summaries. Jump was perfect, it printed only the Final Round skiers from the Awards Summary (when choosing "Scores to Use - Final")  Slalom (when choosing "Scores to Use - Final") - in addition to the final round, it also printed all of the skiers from round 1 (in their correct placement), and sometimes printed them on a separate page. I then tried to print just page 1 but it still printed the separate page.  Tricks - when I tried to print Awards Summary for Tricks it crashed the program.	Exception was caused when the number of preliminary rounds was greater than or equal to the number of rounds. Added better handling to catch this situation and prevent the exception from occurring  The Slalom Award Summary had a bug where it was showing all the skiers when final was selected. Added a check to only show the number of skier placements specified.
Closed	H	4.0.0.8	Windows XP Support	Program is not installing successfully on Windows XP	The .NET dependencies had been updated but were updated to a version not supported by Windows XP. Reduce the version dependency and that will correct the Windows XP install issue. Program still runs properly in all other environments
